SUMMARY

Teams hand me the projects that are mid-flight, under-scoped, or already broken, and I take them to launch. I've spent 7+ years building production software and the infrastructure it runs on, and at Meta I build an internal platform for software license management, working from the graph entity schema and GraphQL layer up through the React UI. Outside of work I ship my own products, including a 3D restaurant sim released on Steam and a multiplayer game prototype with server-authoritative netcode.

EXPERIENCE

Software Engineer / Site Reliability Engineer, Meta (via Crystal Equation)

Sep 2021 — Present

- Built the bulk of the front end for a historical license usage and cost analytics tool covering 132 services across 120 license servers: self-serve breakdowns by user, cost center, and feature that surface wasted license spend.
- Took over Real Time Metrics as a high-priority mid-project handoff and shipped it to close: license queue and denial charts with reason breakdowns, tabbed views, and an in-card UX replacing the old modal flow. Added virtual rendering and refactored 1,400+ lines of column factories and query helpers.
- Designed and shipped version history with one-click restore for the license platform, owning it from scoping through rollout and docs. Cut configuration recovery time by 90%, from ~10 minutes to under 1 minute.
- Designed new node and edge types in the platform's graph entity schema (Hack, internal GraphQL ORM) and wrote the parser that unifies FlexLM, RLM, and custom license managers into a single model, covering 555 license features across 925 feature groups and enabling per-feature gating and usage metrics.
- Shipped a per-service alerting subsystem: an observer and async job that opens a pull request adding alert configs to the observability stack, plus backfill tooling and status-driven auto-suppression. Replaced manual config work.
- Hardened the platform's Python agent with end-to-end tests and a service monitor, surfacing failures early. Root-caused a production bug causing infinite React re-renders and restored the app for all users within 30 minutes.
- Onboarded 5+ large third-party apps with infrastructure as code (Chef, Terraform, Docker, Kubernetes), including Airflow on Kubernetes with SSO and a custom encrypted storage solution, and wrote the disaster recovery runbooks.
- Rated Exceeds Expectations in six consecutive review cycles, landing 55 code changes and closing 290+ tasks in the most recent half. Mentored three engineers to independent ownership and ran Lunch & Learn sessions for the org.

Systems and Software Engineer, PARC (a Xerox Company)

Jul 2019 — Sep 2021

- Built a full-stack web app (Person DB) managing 100% of employee and visitor records: Python/Flask backend, React front end, Azure AD SSO, GitLab CI deploys, and auto-provisioning across Active Directory, NIS, and Microsoft 365.
- Led a migration of DNS, DHCP, and IPAM off legacy tools (BIND, NIS) onto Infoblox with under an hour of downtime.
- Set up Microsoft 365 backups and hybrid-cloud automation to support the company's move to the cloud.

System Administrator, PARC (a Xerox Company)

Oct 2016 — Jul 2019

- Automated account creation and ETL jobs in Python and PowerShell, dropping account setup from 5 hours to 30 minutes.
- Helped migrate the company from Exchange 2010 to Microsoft 365, and handled IAM, AD groups, NTFS permissions, DNS, and monthly patching across Windows and Linux.

PROJECTS

[Guac & Load](#)

Steam, Nov 2025

- A 3D restaurant simulator with a zombie outbreak twist, built solo in Godot. I took it from prototype to release.

[Dank Nooners](#)

WebRTC multiplayer

- A 3D open-world multiplayer motorcycle stunt game. I built server-authoritative netcode over WebRTC, procedural animation with inverse kinematics, realistic driving physics, and a pluggable game-mode system.

[Mini Macro Pad](#)

15 GitHub stars

- A Go + Arduino + 3D printed macro pad. I rebuilt it from Python to Go, refactoring a monolithic GUI into an MVC architecture with a custom [drag-and-drop](#) Fyne widget for the config editor.

SKILLS

- Languages: Go, Python, JavaScript/TypeScript, Hack/PHP, GDScript/Godot, Ruby, C, Bash
- Backend & Web: React, GraphQL, REST, graph entity schemas (node/edge modeling), Flask, WebRTC, SQLite, Nginx
- Infrastructure: Docker, Kubernetes, Terraform, Chef, AWS, Azure, CI/CD
- Practices: Git, Linux, testing (pytest, end-to-end), AI-assisted development with Claude Code
- Certifications: Certified Kubernetes Administrator (CNAF), 2025
