SUMMARY

I'm a Full-stack software engineer with 7+ years across DevOps and production software. At Meta I help build a single-pane-of-glass platform that centralizes software license management across many backend servers, working from the database and GraphQL schema down to the React UI. Outside of work, I build side projects to become a better, more efficient engineer, and learn whatever a project demands to ship it. For instance, my macro pad took Go, MVC, Arduino, and 3D printing. My games took software architecture, state machines, real-time multiplayer, and procedural animation. I come from an SRE background, with a love for programming, automation, and learning new skills.

EXPERIENCE

Site Reliability Engineer / Software Engineer, Meta (via Crystal Equation)

Sep 2021 — Present

- Designed and built version history + one-click restore feature for the license platform, owning it from scoping through creating docs. This cut config recovery by 90% (from ~10 min to under 1 min).
- Extended the platform's entity schema (database + GraphQL) with a new table and parser to unify licenses from FlexLM, RLM, and custom managers. The parser modeled 555 features and 925 feature groups for per-feature license gating and usage metrics.
- Led the React redesign of the portal's main "home" view from proof of concept to MVP: default table-view layout with saved user preference, cost visibility, richer columns, and faster pagination. Also added a metric tracking adoption vs. the old UI.
- Diagnosed and fixed many production bugs, including one that caused infinite React re-renders. I traced the root cause and restored the app for all users within 30 minutes.
- Hardened the platform's Python agent with end-to-end tests and a service monitor, surfacing failures early.
- Onboarded 5+ large third-party apps with infrastructure-as-code (Chef, Terraform, Docker, Kubernetes) and documented disaster recovery, including deploying Airflow on Kubernetes with a custom storage solution and SSO.
- Promoted to Level 3 with consistent Exceeds Expectations ratings; lead ambiguous, high-priority projects end to end, mentor junior engineers, host multiple Lunch & Learn sessions, and hold 99.99% uptime on-call.

Systems and Software Engineer, PARC (a Xerox Company)

Jul 2019 — Sep 2021

- Built an internal full-stack web app ("Person DB") to manage 100% of employee and visitor records, with a Python/Flask backend, a React front end, Azure AD SSO, and a mobile-friendly UI. Wired it up to automatically create and manage accounts across Active Directory, NIS, and Microsoft 365. Used GitLab CI to automate deployments.
- Led a migration of DNS, DHCP, and IPAM off legacy tools (BIND, NIS) onto Infoblox with under an hour of downtime.
- Set up Microsoft 365 backups and hybrid-cloud automation to support the company's move to the cloud, replacing the stopgap fixes that were in place.

System Administrator, PARC (a Xerox Company)

Oct 2016 — Jul 2019

- Automated account creation and ETL jobs in Python and PowerShell, dropping account setup from 5 hours to 30 minutes.
- Helped migrate the company from Exchange 2010 to Microsoft 365, and handled day-to-day IAM, AD groups, NTFS permissions, DNS, and monthly patching across Windows and Linux.

PROJECTS

Game Dev

- [Guac and Load](#) (on Steam): My first 3D game, a restaurant simulator with a zombie outbreak twist. Built in Godot, the game taught me the value of keeping clean code, how to complete a large project, and much more.
- [Dank Nooners](#): A 3D open-world multiplayer motorcycle stunt game. I built a server-authoritative multiplayer prototype over WebRTC, a procedural animation system using inverse kinematics, a state-machine menu system, realistic driving physics, and an abstract game-mode system that allows for multiple mini-games.

Mini Macro Pad

15 GitHub stars

- A Go + Arduino + 3D printed macro pad. I rebuilt it from Python to Go, refactoring a monolithic GUI into an MVC architecture with a custom [drag-and-drop](#) Fyne widget for the config editor. I learned MVC first by writing a [tip calculator](#) from scratch.

SKILLS

- Languages: Go, Python, JavaScript/TypeScript, Hack/PHP, Ruby, C, Bash
- Backend & Web: React, REST, GraphQL, Flask, SQLite, Nginx
- Infrastructure: Docker, Kubernetes (Certified Kubernetes Administrator), Terraform, Chef, AWS, Azure
- Practices: Git, CI/CD, Linux, design patterns, plan-driven AI-assisted development with Claude Code
